

FLAKES

calcium

Chloride

Dust Control

Available in:
20 kg - 35 kg
and 1 000 kg

For more than 100 years, Calcium Chloride flakes has been the standard in the dust control spreading industry. It stands out from other dust control products due to its increased effectiveness and great versatility. Furthermore, Warwick Salt's calcium chloride now holds the BNQ 2410-300/2009 certification. This certification is now required by the Ministère du Développement Durable, Environnement et Parcs. It thus ensures its users the respect of the new environmental standards.

Contractors and municipalities are making Calcium Chloride flakes their first choice for road dust control and stabilization. It is available in 20 kg, 35 kg and 1 000 kg package sizes.

Advantages of using

Calcium Chloride flakes

- Product spreading is done whenever the municipality or contractor finds it appropriate, and not according to the liquid calcium provider's availability.
- Spreading can be done immediately after levelling, therefore only once, which is not always the case with liquid calcium chloride.
- Municipal employees or local contractors can carry out the entire process, supporting use of local labour.
- Consequently, quantities will be spread according to specific needs.
- No minimum purchase volume is required.
- No loss of raw material due to road traffic, when applied according to recommendations.
- Greater flexibility, bags can be kept in stock or easily ordered to meet sporadic needs
